PREPARATION BOOTCAMP

Last but not least...This is probably the most important part of your bootcamp, since it will reinforce your learnings through reflexivity.

A break and time for reflection

After intensive days full of exercises, it's time to take a step back. The goals are to:

- ✓ review the exercises completed throughout the course;
- ✓ retry the uncompleted ones;
- ✓ identify your successes and challenges;
- ✓ analyze your progress and areas for improvement;
- ✓ share your thoughts, reflections, tips and tricks.

Take this opportunity to reflect on your journey, assess your progress to recognize how far you've come and appreciate your sense of accomplishment.

Also, you should take this time as a moment to breathe before diving into new challenges!

Top 3

Write down the 3 top-notch tips you've learned during this bootcamp.
Discuss this with your pedagogical referent and/or your fellow comrades.

It may deal with Python, shell, security, sociability...

Worst 3

Write down the 3 lamest points you missed during this bootcamp.
Discuss this with your pedagogical referent and/or your fellow comrades.

Best practices

In small groups, pretend you are running a business that hires lots of developers each year.

To homogenize the coding practices among them (to be able to re-use as much code as possible among developers), write what you would consider the most important rules to follow when coding.

Discuss them with as many people as possible.

Are you even sure you always comply with these best practices?

Code review

- ✓ Find some fellow comrade(s) to team with.
- ✓ Pick [randomly] an exercise that you've all successfully completed.
- ✓ Then, analyze, comment and improve each other's code.
- ✓ Finally, show your scripts to the pedagogical staff and ask for their feedback.

This is called **code review**: it fosters higher code quality and knowledge sharing.

HOW TO MAKE A GOOD CODE REVIEW

Self and peer evaluations

Step 1

Evaluate yourself concerning the following points:

- ✓ can you navigate into a Linux filesystem?
- ✓ can you write a simple program in Python?
- ✓ can you write a more complex program in Python?
- ✓ can you find a bug in a Python program?
- ✓ can you find information on the Internet to solve a problem?
- ✓ can you ask someone around you when you are stuck?
- ✓ can you help people around you?
- ✓ can you efficiently test a program?

You can use a "crap/noob/average/goat" scale, or whichever you fancy.

Step 2

Evaluate some colleagues with whom you worked during this bootcamp.

Step 3

Show these evaluations to your colleagues, and compare them with their own.

Step 4

Show your evaluations to the pedagogical staff and ask for their feedback.

Congrats

You can now have a well-deserved break.
